

Newsletter 19: Doctors, Government and Media Misinformation in Australia

4th May 2013

Re Ingredients of Vaccines:

Aluminium hydroxide, Aluminium hydroxide/phosphate, Aluminium phosphate, Borax, Egg Protein, Formaldehyde, Gelatin, Gentamicin (antibiotic), Kanamycin (antibiotic), Monosodium Glutamate (MSG), Neomycin (Antibiotic), Phenol, Phenoxyethanol, Polymyxin (antibiotic), Thiomersal (mercury compound), Yeast (current up to March 2013)

Currently the government, doctors and the media are informing the community that if you inject the above ingredients into the tissues of developing infants you will improve the health of your children. Yet over the last 2 decades our children have become less healthy with significant increases in debilitating chronic illness that permanently affects their quality of life.

Here is the misinformation that is being provided by the Australian Government, doctors and the media about vaccination. I hope that you will discuss this information with your doctor and ask them to reply because I would like to publish their responses on my website. If you could ask them to reply personally with the address of their General Practice I will ensure they are presented for debate on my website:

1. Vaccines have reduced the deaths and illness from infectious diseases.

Not True: Vaccines did not reduce the deaths and illness from infectious diseases and many vaccines have been added to the schedule without a proper debate of the risks and benefits. Therefore it is untrue that deaths to infectious diseases will return in developed countries if people do not vaccinate. You will notice these diseases are still prevalent in developing countries – even though they have had vaccination programs for decades.

2. 'Vaccination' is 'immunisation'.

Not True: The government is misusing these words on its website. Vaccination is the act of getting a vaccine – not all recipients receive immunity after a vaccine therefore doctors and the government should always be referring to 'vaccination' not 'immunisation'. Immunisation implies that immunity has been achieved and this is not proven. Some vaccinated people still get the diseases they are vaccinated against so the government has a 'vaccination policy' not an 'immunisation policy' – this is being misrepresented to the public.

3. Vaccines do not cause autism

Not True: The government's schedule of vaccines has never been tested for safety against unvaccinated children (or animals and hence the policy is unethical in children) therefore it has not been proven that vaccines do not cause autism. The current scientific evidence suggests it is the most likely cause of autism.

Please also be aware that discrimination on the basis of vaccination in Australia is unlawful. If there are academic institutions, schools or workplaces that are compelling you to accept vaccines then they are acting against the law. This also applies to court cases which cannot compel any individual to accept vaccines in Australia because there is currently 'no legislation or regulation in Australia's vaccination policy' to do so (HR Commission). Australia's policy is only a recommendation that the public participates in this medical procedure.

In Australia it is entirely your choice whether you wish to vaccinate or not and the merits of each vaccine should be addressed separately. Please let me know if you are experiencing any discrimination on the grounds of vaccination.

Kind regards,

Judy Wilyman

PhD Candidate
