

Newsletter 61 HPV Vaccine: The Decision I will always Regret

12 September 2014

I would like to share with you one of the tens of 1,000's of stories of adverse events after HPV vaccine that are occurring globally. As you read this story please keep in mind the following facts:

1) A criminal court case against the Merck-Sanofi Pasteur Laboratories and the Spanish health authorities is currently being held in Spain and many court cases are in progress in France and India regarding the harm caused by this vaccine. This vaccine has also been removed from some national vaccination programs including Japan and India due to a lack of knowledge of their safety and efficacy.

2) The World Health Organisation (WHO) states that Pap screening is the safest and most effective prevention for cervical cancer. Early detection of abnormal cells allows for them to be removed to prevent any progression to cancer. However, the WHO does not recommend Pap screening before 26 years of age because abnormalities in young women are known to naturally regress and in most cases never lead to cancer later in life. Cervical cancer occurs in women over 30 years of age. The majority of high-grade (CIN 3) lesions in women under 26 years of age regress naturally and are not a predictor of cancer later in life. This is why Pap screening is not needed in women under 26 years of age. Cervical cancer is a very low risk in women in Australia because the risk factors (co-factors needed with an HPV infection) for cancer to occur are not prevalent. 90% of cervical cancer occurs in the developing world.

Here is one of many stories of adverse events after HPV vaccination that is occurring globally:

Courtney's Mum: The decision I will always regret

Wendy, Courtney's mom, wants to share with you her daughter's story and what happened to her after receiving the Gardasil vaccine – thankfully only one shot.

“In the summer of 2012, I took my daughter to her Pediatrician for her routine annual exam. Her doctor strongly recommended that Courtney receive Gardasil because they highly recommend this vaccine for teens. Within 3-4 weeks after Courtney had her first and only Gardasil vaccine, she complained of headaches daily, extreme fatigue, and nausea. She had little to no energy which was NOT like my daughter. She became very moody, irritable and almost depressed. Soon she was complaining about not wanting to eat, muscle weakness and tremors. Her hands would shake uncontrollably, along with her legs. I noticed at times her hands would look mottled, then turn purple/blue in color. If you have ever seen a person after they pass, this is what her hands looked like. This truly scared me as I am a nurse by profession and I felt like I was watching my sweet outgoing daughter deteriorate.”

After going through many, many tests Courtney was eventually diagnosed – in mom’s own words “Then we met with her case doctor, she diagnosed Courtney with "Autonomic Dysfunction". This is a neurologic disease that they are also seeing more of. She has been placed on a high salt diet, drinking a lot of fluids especially water, placed on an exercise regime, and she takes a prescription for this 3 times daily.”

“She was full of life UNTIL she received her first and only Gardasil vaccine and this is a decision I regret every second of every day – if only I could turn back the clock!”

“Therefore, to all the families out there who are thinking about having their daughters vaccinated with Gardasil please, please be careful, do your own research and see the high number of young ladies and guys who are experiencing serious health issues following vaccination. You have a healthy child one day and after being vaccinated with Gardasil, or Cervarix, this healthy child is no more. They develop unexplained health issues which more than often are misdiagnosed and in many cases a finger is pointed at them that their condition is “psychosomatic”. Please believe me your child is sick and requires medical attention – never allow anyone to try and make this out to be a mental health issue. What happened to my daughter I know, and believe, that her symptoms were caused by Gardasil.

Please take the time to visit the Sanevax (Safe, Affordable, Necessary and Effective Vaccines) website www.sanevax.org to investigate Gardasil (HPV vaccine) before consenting to its use in children in school vaccination programs. Please also inform the health department of any problems your child notices after having this vaccine.
